**CADDs – Software Docking Device (SDD)** Autodesk CADDs are a collection of computers for Autodesk software development purposes. CADDs are standardised, high-performance computers which deliver several standardised software development environments, in particular: Vyatta – A Linux distribution developed and maintained by Vyatta Systems for producing Vyatta firewalls. Web (Apache Tomcat) Server – A web application server developed by the Apache Software Foundation. Archon – An embedded web server and application server developed by Archon Technologies that provides web services for external clients (Archon Collaboration Framework). COM Server – An embedded COM server developed by Vyatta for enabling communication between CADDs. Velocity – A mainframe based enterprise Java platform developed by Vyatta. It includes the following software products: FLEXSI – Flexibility Runtime Environment for a Java System Interface; JAVA – A bytecode virtual machine; JSR (Java Specification Request) – Specification for programming languages; PLEX – PLEX Technology is a computing environment for small to medium size enterprises. PLEX combines the best software engineering tools and practice with modern architectures such as virtualization to build a flexible, secure, scalable and maintainable application platform. Open PLEX: A derived version of PLEX, with the source code released under the GNU General Public License JDBC Server – A database server based on the Java Database Connectivity specification MXF Server – An MXF-based streaming media file server developed by Vyatta. It can be embedded in a CADD using the COM component Vyatta COM Server. SIMPLE – A multi-tenancy J2EE platform for development of distributed applications, using the Java/Servlet 2.5 APIs with the Apache Tomcat web server. Current trends in the management of non-muscle invasive bladder cancer: Where are we going? Bladder cancer is the second most common cancer and the fourth cause of cancer-related death in Europe. Over the last decades, we have observed a significant change in the epidemiology of the disease, mainly due to an increase in the diagnosis of non-muscle invasive tumors and the efficacy of the treatment. The introduction of the transurethral resection (TUR) has made possible a shift in the management of bladder cancer. The TUR technique is still the gold standard for the treatment of non-muscle invasive bladder cancer (NMIBC) and is considered the best therapeutic option for both prevention of disease progression and for the treatment of the primary tumor and its recurrences. Moreover, since about 20 years, TURBT followed by intravesical chemotherapy has been the standard of care for patients with high-risk NMIBC. The novel developments in the last decade have demonstrated that early, complete, and prolonged responses to the initial TURBT allow a significant reduction in the risk of tumor recurrence and progression, in addition to improving patients' quality of life. In particular, the combination of early-adjuvant chemotherapy, systemic treatment, maintenance treatment and imaging techniques have shown to be effective in the prevention of disease recurrence. Moreover, the development of a specific early-detection method and the treatment of the dysplasia, the recurrence after initial TUR, the use of alternative intravesical agents, as well as the extension of the indications for the intravesical treatment, have increased the number of therapeutic options for patients with NMIBC. In this review, we summarize the most important changes in the current trend of management of patients with NMIBC, such as
